

AI Knowledge Assistant – Example Document

1. What is React?

React is a JavaScript library for building user interfaces. It uses reusable components to divide a user interface into small, manageable parts. A component can receive data through props and manage local data through state.

2. What is FastAPI?

FastAPI is a modern Python web framework for building APIs. It supports type hints, automatic API documentation, request validation, and asynchronous programming. Developers commonly use it to expose machine-learning or AI functionality through HTTP endpoints.

3. What is RAG?

RAG stands for Retrieval-Augmented Generation. In a RAG system, documents are first split into smaller chunks. Each chunk is converted into a vector representation called an embedding and stored in a vector database. When a user asks a question, the system retrieves the most relevant chunks and sends them as context to a language model.

4. What is Docker?

Docker packages an application and its dependencies into a container. Containers help developers run the same application consistently across different environments. A Docker image is a template used to create containers.

5. Example Questions

- What is React used for?
- What are the main features of FastAPI?
- Explain the RAG pipeline.
- Why do developers use Docker?
